

Title: Flue Baffle for High Capacity Direct Fired Vaporizers
Product: Direct Fired Vaporizers, Models 160H-800H
Issue Date: February 10, 2010

Direct Fired vaporizers are often installed and operated in areas that can experience high winds. As a result, the vaporizers can be subject to pilot outages, re-ignitor failures and burnt wires resulting from reverse draft during times of high winds.

Algas-SDI has developed a flue baffle for its high capacity direct-fired vaporizer line that is designed to deflect wind away from the flue outlet thus preventing forced reversed drafting and flame roll out.

As part of Algas-SDI's efforts to continually improve the performance of our direct fired product line, we have added the new flue baffle as a standard feature on models 160H through 800H.

If you, or your customer, are experiencing any of the issues described above, flue baffles are also available as an accessory for field installation on existing units. Please contact your local representative or Algas-SDI for additional information.

At Algas-SDI we are committed to continuous improvement and customer satisfaction. If you have any questions regarding this bulletin or have an improvement suggestion you would like to make, please write or phone Customer Service.
